Comprehension:

Read the given passage and answer the questions that follow.

A social disease that persists from generation to generation is prejudice. The Latin word *prejudium*, which implies prejudging, is the source of the English word prejudice. It is making a judgement or developing an attitude or belief in advance. It is an assessment made prior to coming into touch with the stimulus or object upon which the assessment is based. A bias is a collection of stereotypes, myths, and legends that employ a group label or symbol to categorise, describe or define an individual or a group taken as a whole. Thus, one is influenced by the actions, viewpoints, preconceptions, and of course, prejudices of the group when creating a prejudice. Prejudice is a bias that is typically regarded to be a negative attitude towards people, objects, organisations, nations, and nationalities. It is created either to serve the interest of the group or the individual interest. Some people believe that bias is a bad attitude. However, this is incorrect. Both positive and negative attitudes toward a member of a certain social group are referred to as prejudice. Contrarily, discrimination describes unfavourable behaviours taken against particular social groupings, individuals, or institutions. Bias results from the oversimplification of social experiences, which is, what causes prejudice. A member of a particular community mistreats you while you're on a train. All of a sudden, you start to feel resentful of them. We tend to jump to conclusions when it comes to other people, despite the advice of academics, social reformers, social scientists, and every rational person for that matter. We make snap decisions about them, especially the outgroups.

Prejudices are unfounded, unscientific judgments that assume people have specific characteristics and take them for granted. Instead, we anticipate that they will behave in certain ways only by virtue of their membership in particular groups. This particular propensity is crucial to understanding how prejudice and discrimination work. Here, we make judgments before even making physical contact. The way the characters are shown makes it impossible for us to judge them objectively. Prejudice is described by Baron and Byrne (1988) as a particular attitude in which individual characteristics and behaviour are largely irrelevant. They are loved or despised merely by virtue of being a member of a recognised and distinct social group.

Group prejudice, according to Sherif and Sherif (1969), is defined as members' negative views toward members of the outgroup that are a result of their group's norms. Because of the parents' ingrained preconceptions that have been passed down through the generations, the child is influenced by them and grows up with them. Prejudices lack a scientific nature and they are irrational and prejudiced. Creator has modified Stem instructions yet mentions 'defend' and 'no changes required!!! accept changes and save the item

The forces of good and evil are represented by our in-group and them as the out-group, respectively, in the drama of real life. Who is who depends on which group you belong to. We are the selected, the people of wonderful destiny, and the protectors of our lives, whereas they are the forces of destruction, the inferior people, and the undeserving. Therefore, prejudice is always shown by the 'ingroup' toward the 'outgroup'.

Prejudice, according to Fieldman (1985), is a judgement of a group's members that is made primarily based on the fact that they belong to that group rather than necessarily because of specific traits of any given member. Prejudice against women arises because they are women, not because of any unique or particular traits or attributes that they possess. Although prejudice is typically thought of as a bad thing, Fieldman contends that it can also be a good one. People may not like the members of the outgroup, but they may favourably assess those who belong to their own group, the 'ingroup', solely on the basis of that membership. As a result, prejudice is a form of bias and unfounded judgment that can be both positive and negative. In both instances, the bias or judgement is not based on the characteristics of a specific person, but rather on the group to which the person belongs. According to Allport, prejudice is a negative attitude held toward people because they are members of, or have been suppressed from being members of, particular groups. Prejudice, in the words of Kretch and Crutchfield, is defined as an attitude or belief that helps to favour or disadvantage the subject of the attitude or belief. Even within the same nation or race, there are substantial differences in people's prejudices in terms of their clarity, specificity, strength, relevance, and verifiability in addition to their content. There are several types of prejudice. There may not necessarily be an active violent component to prejudice. Prejudice frequently merely entails the prejudiced person avoiding the outgroup.

Comprehension:

Read the given passage and answer the questions that follow.

A social disease that persists from generation to generation is prejudice. The Latin word prejudum, which implies prejudging, is the source of the English word prejudice. It is making a judgement or developing an attitude or belief in advance. It is an assessment made prior to coming into touch with the stimulus or object upon which the assessment is based. A bias is a collection of stereotypes, myths, and legends that employ a group label or symbol to categorise, describe or define an individual or a group taken as a whole. Thus, one is influenced by the actions, viewpoints, preconceptions, and of course, prejudices of the group when creating a prejudice. Prejudice is a bias that is typically regarded to be a negative attitude towards people, objects, organisations, nations, and nationalities. It is created either to serve the interest of the group or the individual interest. Some people believe that bias is a bad attitude. However, this is incorrect. Both positive and negative attitudes toward a member of a certain social group are referred to as prejudice. Contrarily, discrimination describes unfavourable behaviours taken against particular social groupings, individuals, or institutions. Bias results from the oversimplification of social experiences, which is, what causes prejudice. A member of a particular community mistreats you while you're on a train. All of a sudden, you start to feel resentful of them. We tend to jump to conclusions when it comes to other people, despite the advice of academics, social reformers, social scientists, and every rational person for that matter. We make snap decisions about them, especially the outgroups.

Prejudices are unfounded, unscientific judgments that assume people have specific characteristics and take them for granted. Instead, we anticipate that they will behave in certain ways only by virtue of their membership in particular groups. This particular propensity is crucial to understanding how prejudice and discrimination work. Here, we make judgments before even making physical contact. The way the characters are shown makes it impossible for us to judge them objectively. Prejudice is described by Baron and Byrne (1988) as a particular attitude in which individual characteristics and behaviour are largely irrelevant. They are loved or despised merely by virtue of being a member of a recognised and distinct social group.

Group prejudice, according to Sherif and Sherif (1969), is defined as members' negative views toward members of the outgroup that are a result of their group's norms. Because of the parents' ingrained preconceptions that have been passed down through the generations, the child is influenced by them and grows up with them. Prejudices lack a scientific nature and they are irrational and prejudiced. Creator has modified Stem instructions yet mentions 'defend' and 'no changes required!!! accept changes and save the item

The forces of good and evil are represented by our in-group and them as the out-group, respectively, in the drama of real life. Who is who depends on which group you belong to. We are the selected, the people of wonderful destiny, and the protectors of our lives, whereas they are the forces of destruction, the inferior people, and the undeserving. Therefore, prejudice is always shown by the 'ingroup' toward the 'outgroup'.

Prejudice, according to Fieldman (1985), is a judgement of a group's members that is made primarily based on the fact that they belong to that group rather than necessarily because of specific traits of any given member. Prejudice against women arises because they are women, not because of any unique or particular traits or attributes that they possess. Although prejudice is typically thought of as a bad thing, Fieldman contends that it can also be a good one. People may not like the members of the outgroup, but they may favourably assess those who belong to their own group, the 'ingroup', solely on the basis of that membership. As a result, prejudice is a form of bias and unfounded judgment that can be both positive and negative. In both instances, the bias or judgement is not based on the characteristics of a specific person, but rather on the group to which the person belongs. According to Allport, prejudice is a negative attitude held toward people because they are members of, or have been suppressed from being members of, particular groups. Prejudice, in the words of Kretch and Crutchfield, is defined as an attitude or belief that helps to favour or disadvantage the subject of the attitude or belief. Even within the same nation or race, there are substantial differences in people's prejudices in terms of their clarity, specificity, strength, relevance, and verifiability in addition to their content. There are several types of prejudice. There may not necessarily be an active violent component to prejudice. Prejudice frequently merely entails the prejudiced person avoiding the outgroup.

Q.20 What are exfoliation joints?

- Ans
- 1. They are in fact special cases of unloading joints formed parallel to the present land surface in rocks of high compressive strength.
 - 2. They are formed during deformation episodes of rock formation when the differential stress is high enough to induce tensile failure in rock body, irrespective of the tectonic regime.
 - 3. They are formed by the cooling of the hot rock masses, particularly lava, and are commonly expressed as vertical columnar joints.
 - 4. They are formed when erosion removes the overlying rocks, thereby reducing the compressive load and allowing the rock to expand laterally.

Q.10 In a welded plate girder subjected to only uniformly distributed load, the welded connection is provided to connect the web plate to flange plates of the plate girder. The plate girder is designed by using the post-critical method. At any intermediate section of the plate girder, the connection between the web and the flange is designed to transmit _____.

- Ans 1. the maximum horizontal shear force resulting from the bending moment gradient in the plate girder
2. the bending moment at the section of the plate girder
3. half of the total uniformly distributed vertical load on the plate girder
4. the total uniformly distributed vertical load on the plate girder
