Comprehension:

Read the given passage and answer the following questions

1. Scientists have discovered a trove of forty-four planets in solar systems beyond our own in one go, dwarfing the usual number of confirmations from extrasolar surveys.
2. The findings will improve existing models of solar systems, and may help researchers investigate exoplanet atmospheres.
3. Novel techniques developed to validate the find could accelerate the confirmation of more extrasolar planet candidates.
4. Astronomers pooled data from NASA's Kepler and the ESA's Gaia space telescopes. They confirmed the existence of these 44 exoplanets and described various details about them.
5. A portion of the findings yield some surprising characteristics. "For example, four of the planets orbit their host stars in less than 24 hours," said John Livingston, a graduate student at the University of Tokyo in Japan. "In other words, a year on each of those planets is shorter than a day here on Earth," said Livingston, lead author of the study.
6. These contribute to a small but growing list of "ultrashort-period" planets, suggesting that they could be more common than previously believed.
7. "Sixteen were in the same size class as Earth, one in particular turning out to be extremely small - about the size of Venus - which was a nice affirmation, as it's close to the limit of what is possible to detect," said Livingston.

Q.1
6 Which of the following statements about this particular study of exoplanets may be inferred from the passage?

Question ID : 16794316017

Ans ~~X~~ 1.

The existence of exoplanets was known to researchers but the study revealed that they may be more in number than previously suspected and that they may exhibit some surprising characteristics.

~~X~~ 2.

The existence of exoplanets has been confirmed by the study and their characteristics have been thoroughly analysed by the research team.

✓ 3.

The existence of exoplanets and the characteristics of these planets were already known to researchers and the study only confirmed whatever information they already knew.

✗ 4.

The existence of exoplanets was not known to researchers and this study revealed this new facet of the universe to researchers.

Comprehension:

Read the given passage and answer the following questions

1. Scientists have discovered a trove of forty-four planets in solar systems beyond our own in one go, dwarfing the usual number of confirmations from extrasolar surveys.
2. The findings will improve existing models of solar systems, and may help researchers investigate exoplanet atmospheres.
3. Novel techniques developed to validate the find could accelerate the confirmation of more extrasolar planet candidates.
4. Astronomers pooled data from NASA's Kepler and the ESA's Gaia space telescopes. They confirmed the existence of these 44 exoplanets and described various details about them.
5. A portion of the findings yield some surprising characteristics. "For example, four of the planets orbit their host stars in less than 24 hours," said John Livingston, a graduate student at the University of Tokyo in Japan. "In other words, a year on each of those planets is shorter than a day here on Earth," said Livingston, lead author of the study.

New scientific techniques that have been developed could confirm the existence of other planets in other solar systems that have already been spotted and reported on.

✗ 3.

New scientific techniques that have been developed could confirm the existence of other planets in our own solar system that has so far been believed to have only 9 planets.
