Al-driven algorithms enhance medical diagnoses, automate financial transactions and personalise learning experiences. However, these advancements come with significant ethical dilemmas that society must address. Dhe primary concern is bias in AI systems. Machine learning algorithms rely on vast datasets, but if these datasets contain biased information, the AI can reinforce existing prejudices. For instance, AI-based hiring tools have, in some cases, favoured certain demographics over others, leading to discrimination. Similarly, facial recognition software has demonstrated racial and gender biases, raising concerns about fairness and accountability. Another ethical challenge is job displacement. Automation and AI-powered systems have eplaced many traditional roles, particularly in manufacturing and customer service. While AI rerates new job opportunities in technology and data science, it simultaneously eliminates of etriain displaced workers and ensure that technological progress benefits all members of society. Al also raises questions about privacy and surveillance. Governments and corporations noreasingly use AI to analyse personal data, track behaviours and predict consumer preferences. While these applications can improve security and business efficiency, they also hreaten individual privacy. In some countries, AI-driven surveillance has been used to monitor itizens, sparking debates about government overreach and human rights. Perhaps the most profound ethical question is whether AI should make life-altering decisions without human oversight. In healthcare, AI can diagnose diseases with remarkable accuracy,

	Artificial Intelligence (AI) has rapidly integrated into various aspects of human life, revolutionising industries such as healthcare, finance and education. Al-driven algorithms enhance medical diagnoses, automate financial transactions and personalise learning experiences. However, these advancements come with significant ethical dilemmas that society must address. One primary concern is bias in AI systems. Machine learning algorithms rely on vast datasets, but if these datasets contain biased information, the AI can reinforce existing prejudices. For instance, AI-based hiring tools have, in some cases, favoured certain demographics over others, leading to discrimination. Similarly, facial recognition software has demonstrated racial and gender biases, raising concerns about fairness and accountability. Another ethical challenge is job displacement. Automation and AI-powered systems have replaced many traditional roles, particularly in manufacturing and customer service. While AI creates new job opportunities in technology and data science, it simultaneously eliminates others, contributing to economic inequality. Policymakers and business leaders must find ways to retrain displaced workers and ensure that technological progress benefits all members of society. AI also raises questions about privacy and surveillance. Governments and corporations increasingly use AI to analyse personal data, track behaviours and predict consumer preferences. While these applications can improve security and business efficiency, they also threaten individual privacy. In some countries, AI-driven surveillance has been used to monitor citizens, sparking debates about government overreach and human rights. Perhaps the most profound ethical question is whether AI should make life-altering decisions	
	without human oversight. In healthcare, AI can diagnose diseases with remarkable accuracy, but should it be allowed to determine treatment plans without a doctor's input? In criminal justice, AI-driven risk assessment tools help predict the likelihood of reoffending, but can they truly replace human judgement? These dilemmas highlight the need for ethical guidelines and regulatory frameworks. As AI continues to evolve, society must strike a balance between innovation and ethical responsibility. Governments, businesses and researchers must work together to ensure AI is developed and deployed in a manner that unholds fairness transparency and human dignity.
