**Comprehension:**

Read the given passage and answer the questions that follow.

Organ transplantation is common. You might know someone your age who had a transplant. Take Jamie Fiske, for example. She was less than a year old when doctors gave her a new liver because she was born with a disease that stopped her liver from working. Thanks to that transplant, she grew up healthy and strong. Stories like hers show how important organ transplants are. In the United States, about one in 330 people has received an organ transplant, and other Western countries have similar rates. Today, doctors transplant the heart, lungs, liver, kidneys, pancreas and bowel. People who receive an organ transplant often live longer and enjoy a better quality of life. Organ recipients also spend less. Organ transplantation has four steps. Transplant teams ensure each step happens without problems. It begins with caring for the donor, meaning doctors keep the organs healthy with the right medicines and care. The next step is organ retrieval, in which trained surgeons remove the organs from the donor. Next, the organs are stored until they are transplanted. During preservation, the organs must be kept healthy. Finally, surgeons replace a sick organ with a healthy one during transplantation.
