Comprehension:

Read the following passage and answer the questions given below.

A possible link between weight-loss medications based on GLP-1 receptor agonists and a rare eye condition called NAION is being investigated. NAION occurs due to decreased blood flow to the optic nerve, often causing sudden vision loss, usually in one eye. Individuals with risk factors like diabetes, hypertension and small optic nerves are more likely to develop this condition. GLP-1 receptor agonists, originally designed to treat type 2 diabetes, have become popular for weight loss. Recently, some patients using these medications reported experiencing NAION, raising concerns about a potential connection. Experts emphasise that while the timing of these incidents is notable, a direct cause-and-effect relationship has not been confirmed. The mechanisms through which these medications might contribute to NAION are unclear, although theories suggest possible blood pressure changes or dehydration as factors. The growing use of GLP-1-based weight loss treatments means more people could be exposed to these potential risks. Currently, no treatments can reverse the vision loss caused by NAION. Efforts to explore gene therapy for optic nerve regeneration are ongoing, but practical applications are still in development. Health professionals advise patients using GLP-1 receptor agonists to be aware of the symptoms of NAION and seek medical help if they experience sudden vision changes. As research progresses, a better understanding of the connection between these medications and NAION is expected. Until then, careful monitoring and consideration of risk factors are recommended.

SubQuestion No : 58

Q.5 What is a possible reason GLP-1 receptor agonists could contribute to the development of NAION in patients?

8

Ans ☐ 1. Improved blood circulation to the eyes

☒ 2. Changes in blood pressure or dehydration

☐ 3. Increased blood sugar levels

☐ 4. Enhanced optic nerve growth

As research progresses, a better understanding of the connection between these medications and NAION is expected. Until then, careful monitoring and consideration of risk factors are recommended.

SubQuestion No : 59

Q.5 Why are experts cautious about confirming a direct link between GLP-1 receptor agonists and NAION?

- Ans
- ✓ 1. The reported cases are based on timing and correlation, not causation.
  - ✗ 2. The mechanisms of the medications are fully understood.
  - ✗ 3. The medications are only used for diabetes treatment, not weight loss.
  - ✗ 4. NAION is a reversible condition.

As research progresses, a better understanding of the connection between these medications and NAION is expected. Until then, careful monitoring and consideration of risk factors are recommended.

SubQuestion No : 60

Q.6 Why is it significant that GLP-1 receptor agonists are increasingly used for weight loss?

- Ans ☒ 1. It increases the number of individuals potentially exposed to the medication's risks.
- ☐ 2. It leads to rapid vision improvement in NAION patients.
- ☐ 3. It eliminates the need for diabetes management.
- ☐ 4. It reduces the risk factors associated with hypertension.

Q.8  
2

Read the given statements and conclusions carefully. Assuming that the information given in the statements is true, even if it appears to be at variance with commonly known facts, decide which of the given conclusions logically follow(s) from the statements.

Statements: Some sailors are boats. No boat is a rat. No boat is a tree.

Conclusion (I): No sailor is a rat.  
Conclusion (II): Some trees are rats.

Ans

1. Only conclusion (I) follows.

2. Both conclusions (I) and (II) follow.

3. Neither conclusion (I) nor (II) follows.

4. Only conclusion (II) follows.
