Answer questions (11-15) after reading the following passage:
ఈ దిగువ పాసేజీ చదివి 11-15 ప్రశ్నలకు సమాధానము వ్రాయుము.

Passage: The Evolution of Artificial Intelligence (కృత్రిమ మేధస్సు పరిణామం)

The idea of creating "thinking machines" is not new; its roots can be traced back to ancient myths of automatons and intelligent artifacts. However, the modern concept of Artificial Intelligence (AI) truly began to take shape in the mid-20th century with pioneers like Alan Turing. In his 1950 paper, Turing proposed what is now known as the "Turing Test," a criterion for a machine's ability to exhibit intelligent behavior equivalent to, or indistinguishable from, that of a human. Early AI research focused on symbolic reasoning, attempting to create systems that could solve problems through logical rules and symbolic manipulation, the "good old-fashioned AI" (GOFAI) approach. These systems were successful in specific, narrow tasks, like playing chess or solving mathematical equations. However, they struggled with tasks that required common sense or handling uncertain, real-world information.

The limitations of GOFAI paved the way for the rise of connectionism in the 1980s, which draws inspiration from the structure of the human brain. This led to the development of artificial neural networks, which are now the backbone of modern AI. Unlike rule-based systems, neural networks learn from vast amounts of data, identifying patterns and making predictions without being explicitly programmed for every scenario. Deep learning, a subset of machine learning using networks with multiple layers, has enabled breakthroughs in areas like image recognition and natural language processing. Despite these advancements, significant challenges remain. Creating a machine with true consciousness or self-awareness, rather than just simulating it, is still a distant goal. Furthermore, as AI systems become more integrated into society, ethical considerations regarding bias in algorithms, job displacement, and the potential for misuse are becoming increasingly urgent concerns.

Libraries are expected to "add value" to the products and services. Adding value to information is part of the core and expertise of libraries. Value is added to information by facilitating access through indexing and bibliographic description, and through the creation of systems, which make information more logically organized and easier to find.

Generally speaking, library user services can be divided into two categories: library public user services and library technical user services. Library public user services refer to circulation, bibliographic instructions, distance learning, documentation, reference and special collection. Library information user services focus on procedures and operations of maintaining, developing and supporting library collection and services behind the scene such as acquisition, cataloguing, classification, inter library loan, document delivery and serial systems.

In the 1990s,the Internet became the primary platform for libraries to build and deliver information resources, services and instructions. Lately library user information services, also called library user public service became evolving into two sections: traditional library user information services and electronic library user information services. In the digital age, the most common library user information services start from the personal oral or written communications between librarians and library users: Traditional library user information services have the following major features:

Face to face, this face-to-face personal communication includes eye contact, facial expression, oral communication, and written communication.

Onsite, this includes, campus outreach coordination and collaboration, library tour, ready reference, user technical support and virtual reference.

Electronic library user services include the Internet and the worldwide web, computerized library catalogues, digital libraries, distance learning services, e-databases, government, instant message services, interlibrary loan and virtual references.
