Question ID : 1841226908

Comprehension:

Read the given passage and answer the questions that follow.

Acquired Immune Deficiency Syndrome (AIDS) is one of the latest medical tragedies that has become the dominant public health concern. It was not known before 1981 and even now there is a lot about it that we don't know. It is not a disease, but a condition caused by a virus known as HIV (Human Immune Deficiency Virus). It attaches itself to the genetic material of the human cell and infects it. The human body is infected by HIV in three ways: sexual relation with an infected person, transmitted through infusion of blood or blood products and transmitted by HIV infected mother to the newborn child before, during or after birth. Once the person is infected, the immune system of the person will be completely destroyed and will eventually fall prey to any disease. AIDS has no cure and there is no vaccine that can prevent HIV infection so far. The only way to be away from AIDS and to prevent HIV transmission is to practice 'safe behaviour'. Use of disposable syringe in transfusion of blood should be concerned.

AIDS is definitely a life-threatening disease and is one of the most dreaded diseases of the 20th century. It has so far ended more than thirty millions lives all over the world. It has spread like wildfire as the virus replicates itself into the human body by inserting a copy of its DNA into the human host cells. The host cells in which the HIV resides are the WBCs (White Blood Cells) that are part of the human immune system. AIDS prevention lies only in the process of curbing its spread and the only way to fight it is through awareness.

AIDS has no cure and there is no vaccine that can prevent HIV infection so far. The only way to be away from AIDS and to prevent HIV transmission is to practice 'safe behaviour'. Use of disposable syringe in transfusion of blood should be concerned.

AIDS is definitely a life-threatening disease and is one of the most dreaded diseases of the 20th century. It has so far ended more than thirty millions lives all over the world. It has spread like wildfire as the virus replicates itself into the human body by inserting a copy of its DNA into the human host cells. The host cells in which the HIV resides are the WBCs (White Blood Cells) that are part of the human immune system. AIDS prevention lies only in the process of curbing its spread and the only way to fight it is through awareness.

Question ID : 1841226924

Comprehension:

Read the given passage and answer the questions that follow.

Acquired Immune Deficiency Syndrome (AIDS) is one of the latest medical tragedies that has become the dominant public health concern. It was not known before 1981 and even now there is a lot about it that we don't know. It is not a disease, but a condition caused by a virus known as HIV (Human Immune Deficiency Virus). It attaches itself to the genetic material of the human cell and infects it. The human body is infected by HIV in three ways: sexual relation with an infected person, transmitted through infusion of blood or blood products and transmitted by HIV infected mother to the newborn child before, during or after birth. Once the person is infected, the immune system of the person will be completely destroyed and will eventually fall prey to any disease. AIDS has no cure and there is no vaccine that can prevent HIV infection so far. The only way to be away from AIDS and to prevent HIV transmission is to practice 'safe behaviour'. Use of disposable syringe in transfusion of blood should be concerned.
