Q.2 Which statement is false about the built-in potential of the P-N junction diode?

- Ans 1. Built-in potential is also known as Barrier potential or contact difference potential.
 2. Built-in potential for Silicon is 0.7V and Germanium is 0.3V.
 3. PN Junction permits current flow even below the built-in potential.
 4. Built-in potential depends upon the material used, the amount of doping, and the temperature.

Q.5 Which statement is false about filter circuit?

- Ans
- 1. The filter is used to remove the fluctuation or ripple present in the rectifier output.
 - 2. The capacitor opposes changes in current, while the inductor opposes changes in voltage.
 - 3. In a Series inductive filter, ripple increases with the load resistance, but in a shunt capacitive filter, ripple decreases with an increase in load resistance.
 - 4. The pie filter gives better filtering than the LC circuit.

Q.6 Two sets of numbers are given below. In each set of numbers, certain mathematical operation(s) on the first number results in the second number. Similarly, certain mathematical operation(s) on the second number results in the third number and so on. Which of the given options follows the same set of operations as in the given sets?

(Note: Operations should be performed on the whole numbers, without breaking down the numbers into their constituent digits. E.g. 13 – Operations on 13 such as adding/subtracting/multiplying to 13 can be performed. Breaking down 13 into 1 and 3 and then performing mathematical operations on 1 and 3 is not allowed.)
