"This entails that simultaneity is observer-dependent: what appears simultaneous to one observer may not be so to another..."

Read the passage and answer the question:

"Minkowski proposed that space and time are not separate arenas but fused into a single four-dimensional continuum, an idea that naturally follows from Einstein's Special Relativity. Within this model, time ceases to be an absolute Newtonian backdrop and instead becomes interlaced with the three spatial dimensions to form space-time. Events are located as points in this space-time, and their separation is measured not by ordinary Euclidean distance but by the relativistic interval, which remains invariant across reference frames. This entails that simultaneity is observer-dependent: what appears simultaneous to one observer may not be so to another moving relative to the first.

When gravity is introduced through Einstein's General Relativity, the picture deepens further. Gravity is reconceived not as a Newtonian force but as the curvature of space-time produced by mass-energy. Objects travel along geodesics—paths determined by the geometry of curved space-time. A striking consequence is gravitational time dilation: clocks nearer a massive body tick more slowly than clocks farther away. This has been empirically verified, including observations that satellite clocks run slightly faster than clocks on Earth due to weaker gravitational influence."

Within this model, time ceases to be an absolute Newtonian backdrop and instead becomes interlaced with the three spatial dimensions to form space-time. Events are located as points in this space-time, and their separation is measured not by ordinary Euclidean distance but by the relativistic interval, which remains invariant across reference frames. This entails that simultaneity is observer-dependent: what appears simultaneous to one observer may not be so to another moving relative to the first.

When gravity is introduced through Einstein’s General Relativity, the picture deepens further. Gravity is reconceived not as a Newtonian force but as the curvature of space-time produced by mass-energy. Objects travel along geodesics—paths determined by the geometry of curved space-time. A striking consequence is gravitational time dilation: clocks nearer a massive body tick more slowly than clocks farther away. This has been empirically verified, including observations that satellite clocks run slightly faster than clocks on Earth due to weaker gravitational influence.”

Read the passage and answer the question:

“Minkowski proposed that space and time are not separate arenas but fused into a single four-dimensional continuum, an idea that naturally follows from Einstein’s Special Relativity. Within this model, time ceases to be an absolute Newtonian backdrop and instead becomes interlaced with the three spatial dimensions to form space-time. Events are located as points in this space-time, and their separation is measured not by ordinary Euclidean distance but by the relativistic interval, which remains invariant across reference frames. This entails that simultaneity is observer-dependent: what appears simultaneous to one observer may not be so to another moving relative to the first.
