Comprehension:

Read the given passage and answer the questions that follow.

Most planets in the universe appear nearly spherical, or round, because of the influence of gravity. Gravity is the force that pulls matter toward the centre of a massive object. When a planet forms from dust, gas, and rocky material in space, gravity gradually draws this material inward. Over time, the force acts equally in all directions, shaping the object into a sphere. Smaller objects such as asteroids may have irregular shapes because their gravity is too weak to overcome the strength of their solid material. In contrast, large planetary bodies possess sufficient gravity to smooth out uneven surfaces and create a rounded form. Scientists describe this process as reaching hydrostatic equilibrium, a balance between gravity and internal pressure. Understanding why planets are round helps astronomers classify celestial objects and study their formation. Observations of planets in our solar system and beyond continue to improve knowledge about how planetary systems develop throughout the universe.

SubQuestion No : 61

Q.6 Identify the most suitable title for the passage.
1

- Ans**
- A. How Asteroids Differ From Planets
 - B. Gravity and the Shape of Planets
 - C. Why Planets Become Round in Space
