**Comprehension:**

Read the given passage carefully and answer the questions that follow.

The expression “blind as a bat” is commonly used to describe someone who cannot see well, but this phrase is scientifically inaccurate. Bats are not blind; in fact, many species possess reasonably good eyesight. While bats rely heavily on a system called echolocation to navigate in darkness, their eyes still function effectively in low light conditions. Echolocation works when bats produce high-frequency sounds that bounce off objects and return as echoes. By interpreting these echoes, bats can detect obstacles and locate insects while flying. This ability allows them to move with remarkable precision even in complete darkness. Scientists explain that bats combine both vision and echolocation to survive and hunt successfully. The myth likely developed because bats are nocturnal animals that are rarely seen during daylight. However, research clearly shows that bats are not helpless creatures but highly adapted animals with sophisticated sensory abilities.

**SubQuestion No : 61**

**Q.6** Identify the main theme of the passage.  
1

- Ans**
- A. The belief that bats are blind is scientifically incorrect.
  - B. Many bat species possess effective eyesight in darkness.
  - C. Animals often develop sensory systems suited for survival.
  - D. Bats use echolocation to detect insects and obstacles.
