Comprehension:

Read the passage given below and answer questions :

The school age period is one of steady growth, usually with fewer feeding problems than during toddler and preschool years. A natural increase in appetite is responsible for an increase in food consumption. The child's growing independence leads to a gradual transfer of control of food selection from the parent to the child.

Parents or caretakers should provide nutrition education for their children as being role models. Parents should encourage the child to eat appropriate portion size, eating a variety of foods and trying new foods. Negative behaviours such as using food as an emotional coping mechanism or as a reward, should be discouraged. Parents should establish in children healthy eating habits for lowering the risks for nutrition-related chronic diseases.

Between the ages of 8 to 11, some girls may be at risk for developing eating disorders. Snacks remain an important part of the diet. The meal taken on return from school is important to meet the nutritional requirement and to have interaction with parents. Children who do not eat breakfast at home are more likely to buy junkfood. Parents should give healthful breakfast at home before sending children to school.

Though media influence diet choices of children, parents should know nutritional facts and suggest to their children. Government should regulate advertisements aimed at children.

Comprehension:

Read the following passage and answer the questions :

Communicable diseases are illnesses caused by agents such as bacteria, viruses, fungi and parasites that can be transmitted from one person to another or from animals to human. The transmission of communicable disease occurs through various modes including direct contact (such as touching, kissing or sexual contact), indirect contact (via contaminated objects, food, water or fomites), droplet infection (coughing or sneezing), airborne transmission (aerosols that remain suspended in the air), vector borne transmission (through insects like mosquitoes, ticks or fleas) and zoonotic transmission (from animals to humans). Prevention methods are crucial in controlling the spread of these diseases and include immunization, which provides active protection against vaccine-preventable diseases such as measles, polio and tuberculosis. Maintaining proper hygiene such as handwashing with soap and water is essential in preventing feco-oral and respiratory infections. The use of personal protective equipment such as masks and gloves is recommended in health care settings and during out-breaks of airborne diseases. Safe drinking water, proper sanitation and food safety measures reduce the risk of waterborne and foodborne infections. Vector control strategies such as insecticide spraying and eliminating breeding sites, help prevent diseases like malaria and dengue. Health education and early case detection play significant roles in breaking the chain of transmission, ensuring better disease control and prevention.

SubQuestion No : 141

Q.141 Why is early case detection emphasized in communicable disease control strategies ?

- (1) To break the chain of transmission and limit disease spread.
- (2) To reduce the effectiveness of vaccine-preventable disease programs.
- (3) To identify emerging drug-resistant bacterial strains.
- (4) To increase the pathogenicity of infectious agents.
